

AI Assisted Coding

Assignment – 6.5

Name: K. Deekshith

Batch: 21

HtNo: 2303A51414

Task Description-1

- (AI-Based Code Completion for Conditional Eligibility Check)

Task: Use an AI tool to generate eligibility logic.

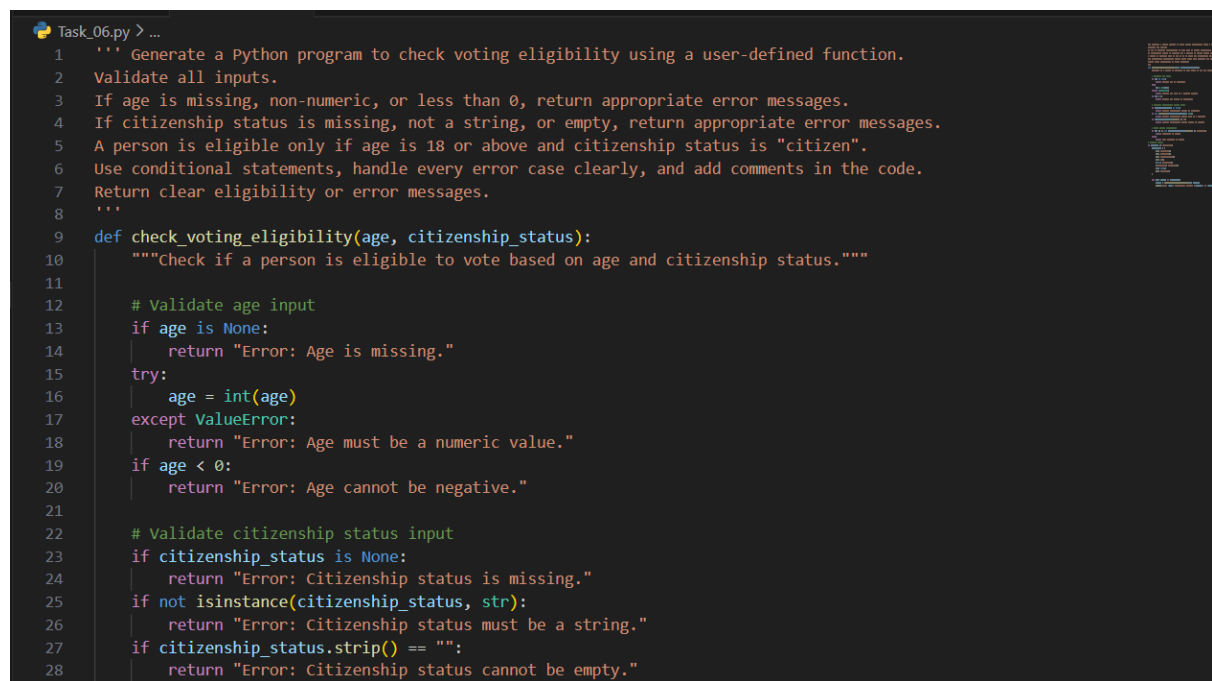

Prompt:

“Generate Python code to check voting eligibility based on age and citizenship.”

Expected Output:

- AI-generated conditional logic.
- Correct eligibility decisions.
- Explanation of conditions.

Code:

A screenshot of a code editor window titled 'Task_06.py > ...'. The code is a Python function named 'check_voting_eligibility' that takes 'age' and 'citizenship_status' as arguments. It includes docstrings, comments, and conditional logic to validate inputs and determine eligibility. The code is as follows:

```
1  """ Generate a Python program to check voting eligibility using a user-defined function.
2  Validate all inputs.
3  If age is missing, non-numeric, or less than 0, return appropriate error messages.
4  If citizenship status is missing, not a string, or empty, return appropriate error messages.
5  A person is eligible only if age is 18 or above and citizenship status is "citizen".
6  Use conditional statements, handle every error case clearly, and add comments in the code.
7  Return clear eligibility or error messages.
8  """
9  def check_voting_eligibility(age, citizenship_status):
10     """Check if a person is eligible to vote based on age and citizenship status."""
11
12     # Validate age input
13     if age is None:
14         return "Error: Age is missing."
15     try:
16         age = int(age)
17     except ValueError:
18         return "Error: Age must be a numeric value."
19     if age < 0:
20         return "Error: Age cannot be negative."
21
22     # Validate citizenship status input
23     if citizenship_status is None:
24         return "Error: Citizenship status is missing."
25     if not isinstance(citizenship_status, str):
26         return "Error: Citizenship status must be a string."
27     if citizenship_status.strip() == "":
28         return "Error: Citizenship status cannot be empty."
```

```

28         return "Error: Citizenship status cannot be empty."
29
30     # Check voting eligibility
31     if age >= 18 and citizenship_status.lower() == "citizen":
32         return "Eligible to vote."
33     else:
34         return "Not eligible to vote."
35
36 # Example usage:
37 if __name__ == "__main__":
38     test_cases = [
39         (20, "citizen"),
40         (17, "citizen"),
41         (25, "non-citizen"),
42         (18, ""),
43         (None, "citizen"),
44         ("eighteen", "citizen"),
45         (22, None),
46         (-5, "citizen")
47     ]
48
49     for age, status in test_cases:
50         result = check_voting_eligibility(age, status)
51         print(f"Age: {age}, Citizenship Status: '{status}' => {result}")

```

Output:

```

PS E:\3_2\AI_AssistantCoding> & C:/Users/Deekshith/AppData/Local/Microsoft/WindowsApps/python3.11.exe e:/3_2/AI_AssistantCoding/Task_06.py
• Age: 20, Citizenship Status: 'citizen' => Eligible to vote.
  Age: 17, Citizenship Status: 'citizen' => Not eligible to vote.
  Age: 25, Citizenship Status: 'non-citizen' => Not eligible to vote.
  Age: 18, Citizenship Status: '' => Error: Citizenship status cannot be empty.
  Age: None, Citizenship Status: 'citizen' => Error: Age is missing.
  Age: eighteen, Citizenship Status: 'citizen' => Error: Age must be a numeric value.
  Age: 22, Citizenship Status: 'None' => Error: Citizenship status is missing.
  Age: -5, Citizenship Status: 'citizen' => Error: Age cannot be negative.
○ PS E:\3_2\AI_AssistantCoding>

```

Explanation:

The AI-generated Python program was used to design a voting eligibility check with proper input validation and clear decision logic. The code was carefully reviewed line by line to understand how age and citizenship inputs are validated, including handling missing, invalid, and incorrect values. Logical flaws and potential errors were identified and addressed by adding appropriate condition checks and exception handling. The program was further refined to improve readability and maintainability through meaningful variable names, structured validation, and clear comments. Responsible use of AI tools was ensured by verifying the logic, correcting mistakes, and fully understanding the code rather than copying the AI-generated output without evaluation.

Task Description-2

- (AI-Based Code Completion for Loop-Based String Processing)

Task: Use an AI tool to process strings using loops.

Prompt:

“Generate Python code to count vowels and consonants in a string using a loop.”

Expected Output:

- AI-generated string processing logic.
- Correct counts.
- Output verification.

Code:

```
TempRun.py X Task_06.py
TempRun.py > ...
1 ''' Generate a Python program to count the number of vowels and consonants in a given string using loops.
2 The program should use a user-defined function.
3 Handle invalid inputs such as empty strings or non-string values with proper messages.
4 Use loop-based logic (no built-in vowel counting methods).
5 Print and return the correct count of vowels and consonants.
6 Include comments explaining the logic.
7 '''
8 def count_vowels_and_consonants(input_string):
9     """Count the number of vowels and consonants in the given string."""
10
11     # Validate input
12     if input_string is None:
13         return "Error: Input string is missing."
14     if not isinstance(input_string, str):
15         return "Error: Input must be a string."
16     if input_string.strip() == "":
17         return "Error: Input string cannot be empty."
18
19     # Initialize counts

PS E:\3_2\AI_AssistantCoding>
```

Explanation :

The AI tool was used to generate a Python program that applies a user-defined function, loop-based logic, and conditional statements to count vowels and consonants in a string. The generated code was carefully examined line by line to understand how input validation, character checking, and counting logic work together to produce correct results. During the review process, potential issues such as empty inputs, non-string values, and invalid characters were identified and handled appropriately to ensure logical correctness. The program was further refined to improve readability and efficiency through clear comments, structured conditions, and meaningful variable names. Responsible use of AI tools was demonstrated by validating the generated solution, correcting errors, and ensuring a clear understanding of the logic rather than using the output without evaluation.

Task Description-3

-(AI-Assisted Code Completion Reflection Task)

Task: Use an AI tool to generate a complete program using classes, loops, and conditionals.

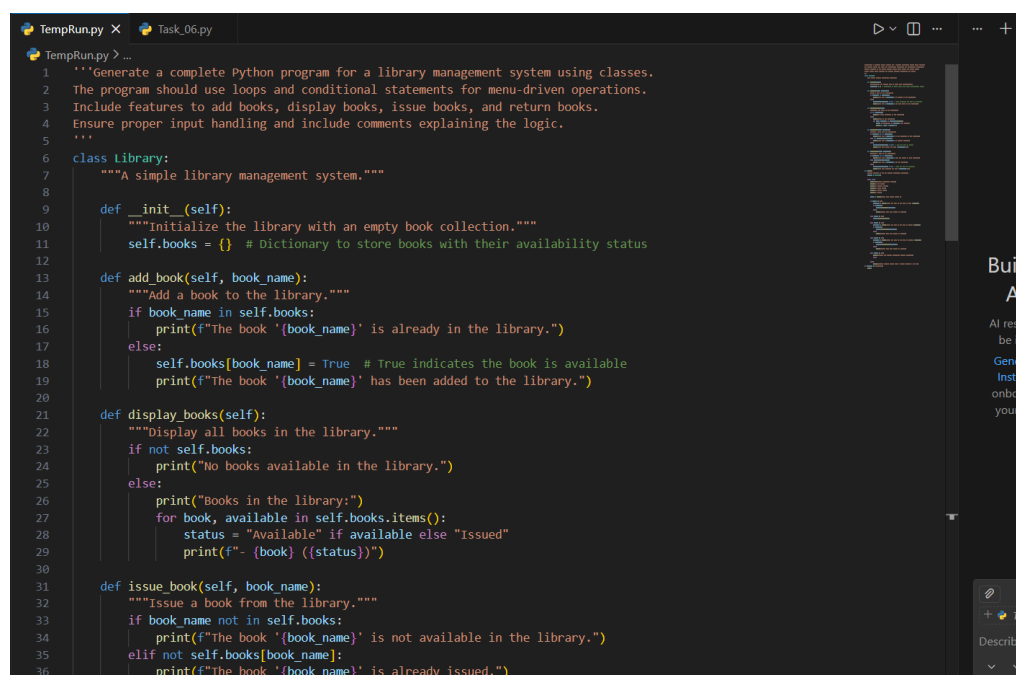

Prompt:

“Generate a Python program for a library management system using classes, loops, and conditional statements.”

Expected Output:

- Complete AI-generated program.
- Review of AI suggestions quality.
- Short reflection on AI-assisted coding experience

Code:

A screenshot of a code editor window with a dark theme. The editor shows a Python file named 'Task_06.py' containing a class-based library management system. The code includes a docstring at the top, a 'Library' class with methods for adding, displaying, and issuing books, and a main execution block. The code is well-commented and uses meaningful variable names. The editor interface includes a file explorer on the left, a search bar, and a sidebar on the right with a 'Build' section.

```
1  """Generate a complete Python program for a library management system using classes.
2  The program should use loops and conditional statements for menu-driven operations.

3. Issue Book
4. Return Book
5. Exit
Enter your choice (1-5): 2
Books in the library:
- Personality Development (Available)
```

Explanation:

The AI-generated Python program was used to design a simple library management system using a class-based approach along with loops and conditional statements for menu-driven operations. The code was carefully reviewed line by line to understand how object-oriented concepts, such as classes, methods, and instance variables, manage book records and availability status. Logical conditions were examined to ensure correct handling of operations like adding, displaying, issuing, and returning books, while also preventing invalid actions such as issuing an already issued book. The program was refined for better readability and maintainability through meaningful method names, clear comments, and structured input validation within the menu loop. Responsible use of AI tools was demonstrated by verifying the generated logic, handling user input errors properly, and ensuring a clear understanding of the program's functionality rather than relying on the AI output without evaluation.

_- (AI-Assisted Code Completion for Class - Based Attendance System)

Task: Use an AI tool to generate an attendance management class.

Prompt: "Generate a Python class to mark and display student attendance using loops."

Expected Output:

- AI-generated attendance logic.
- Correct display of attendance.
- Test cases

Code:

```
TempRun.py > ...
1
2  Generate a Python class for an attendance management system.
3  The class should mark and display student attendance using loops.
4  Include methods to add students, mark present or absent, and display attendance.
5  Use conditional statements, handle basic invalid inputs, and add comments explaining the logic.
6  Generate a complete executable program.
7  ...
8  class AttendanceManagementSystem:
9      """
10     A class to manage student attendance.
11     """
12
13     def __init__(self):
14         """
15         Initialize the attendance system with an empty dictionary.
16         Key -> student name

2. Mark Attendance
3. Display Attendance
4. Exit

```

Explanation:

The AI-generated Python program was used to develop an attendance management system using a class-based structure along with loops and conditional statements for menu-driven operations. The code was reviewed in detail to understand how methods are used to add students, mark attendance as present or absent, and display attendance records using dictionary-based storage. Conditional checks were analysed to ensure proper handling of invalid inputs such as empty names, incorrect attendance status, and non-existing students. The implementation was refined to improve readability and maintainability by using meaningful method names, clear comments, and structured control flow within the loop. Responsible use of AI tools was demonstrated by validating the generated logic, handling edge cases correctly, and ensuring a clear understanding of the program's functionality rather than relying on the AI output without verification.

Task Description-5

- (AI-Based Code Completion for Conditional Menu Navigation)

Task: Use an AI tool to complete a navigation menu.

Prompt: "Generate a Python program using loops and conditionals to simulate an ATM menu."

Expected Output:

- AI-generated menu logic.
- Correct option handling.

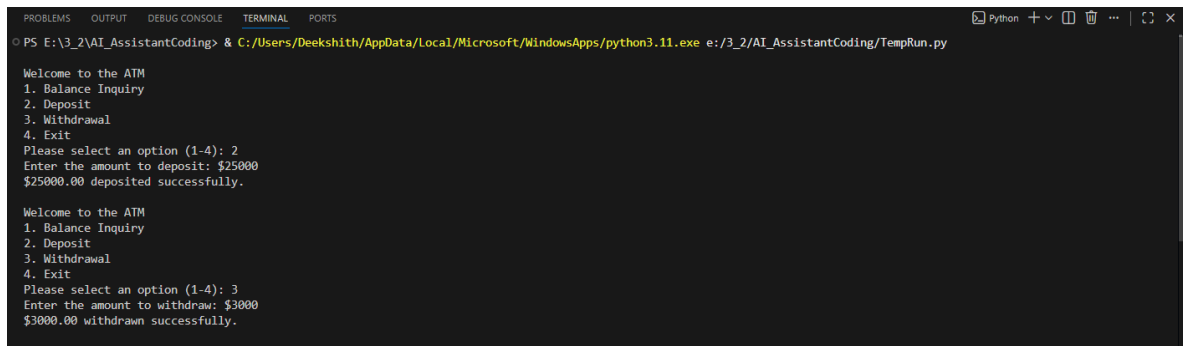

- Output verification.

Code:

```
TempRun.py X
TempRun.py > ...
1  """Generate a Python program to simulate an ATM menu using loops and conditional statements.
2  The menu should include options for balance inquiry, deposit, withdrawal, and exit.
3  Use a loop to keep the menu running until the user exits.
4  Handle invalid menu choices and invalid transaction amounts.
5  Generate a complete executable program with comments.
6  """
7  def atm_menu():  # Initialize the user's balance
8      balance = 0.0
9
10     while True:
11         # Display the ATM menu
12         print("\nWelcome to the ATM")
13         print("1. Balance Inquiry")
14         print("2. Deposit")
15         print("3. Withdrawal")
16         print("4. Exit")
17
18         # Get the user's choice
19         choice = input("Please select an option (1-4): ")
20
21         # Handle the user's choice
22         if choice == '1':

54         print("Thank you for using the ATM. Goodbye!")
55         break
56
57     else:
58         # Invalid menu choice
59         print("Invalid choice. Please select a valid option (1-4).")
60
61 # Run the ATM menu function
62 if __name__ == "__main__":
63     atm_menu()
```

Output:

A screenshot of a Python terminal window. The title bar shows 'Python' and standard window controls. The terminal output shows a menu-driven ATM simulation. It starts with 'Welcome to the ATM' and a list of options: 1. Balance Inquiry, 2. Deposit, 3. Withdrawal, 4. Exit. The user selects option 2, enters '\$25000', and the program outputs '\$25000.00 deposited successfully.'. The menu is shown again, and the user selects option 3, enters '\$3000', and the program outputs '\$3000.00 withdrawn successfully.'. The terminal path is 'PS E:\3_2\AI_AssistantCoding> & C:/Users/Deekshith/AppData/Local/Microsoft/WindowsApps/python3.11.exe e:/3_2/AI_AssistantCoding/TempRun.py'.

Explanation:

The AI-generated Python program was used to simulate an ATM system using loops and conditional statements to provide a menu-driven interface. The code was carefully examined to understand how the loop keeps the menu running until the user chooses to exit and how conditional branches handle balance inquiry, deposit, and withdrawal operations. Input validation was analysed to ensure that invalid menu selections, non-numeric inputs, negative amounts, and insufficient balance cases are handled correctly. The program structure was reviewed to identify and prevent logical errors, while clear comments and meaningful variable names were used to improve readability and maintainability. Responsible use of AI tools was demonstrated by verifying the generated logic, testing different transaction scenarios, and ensuring correct behaviour rather than relying on the AI output without evaluation.
